DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 09/22/2010 has been entered.

Examiner's Amendment

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee. Authorization for this examiner's amendment was given in a telephone interview with Gerald Shekleton on October 28, 2010. The application has been amended as follows:

Claim 12 is deleted and replaced with -

A method for producing nitrogen fertilizer from organic waste products in the liquid phase and for hygienizing the wastes and reducing emissions by thermal treatment using mineral or organic additions, wherein the waste product is heated in a

first vessel without acids or alkali to temperatures between 40 and 90° C, as the pressure is first evacuated to 10 to 30 kPa, and then the pressure is increased to 40 to 80 kPa, so as to remove carbon dioxide and almost all ammonia without being accompanied by appreciable amounts of water, wherein the escaping gas containing carbon dioxide and ammonia is cooled down and then introduced into a second vessel, to an aqueous absorption agent, or brought into contact therewith, the nitrogen fertilizer formed thereby is discharged into a container and the excess gas not having been absorbed and containing carbon dioxide is conducted back into the process and circulated between the first and the second vessel, whereby the temperature of the discharge container is maintained at a predetermined value such that the underpressure between 10 and 80 kPa generated at the beginning of the process by a vacuum pump is autogenously maintained by the progress of the process, and the ammonium nitrogen fertilizer may be nearly fully removed. --

Claim 13 is deleted and replaced with -- The method according to claim 12, wherein the excess gas containing carbon dioxide is not absorbed and is conducted back into the cycle by either

conducting it through the waste product to be treated, or conducting it immediately above the waste product to be treated, or conducting it through a gas cooling system above the waste product to be treated, or dividing it and conducting a partial flow through the waste product and another partial flow above the waste product. —

Claim 16 is deleted and replaced with -- The method according to claim 12, wherein fermented manure is used as waste product and the fermented manure is heated to 70 to 85°C at a reduced pressure.

-- Claim 19 is deleted -

-- Claim 20 is deleted -

Allowable Subject Matter

Claims 12-18 are allowed.

The following is an examiner's statement of reasons for allowance:

The closest prior art on record - Woodruff - teaches a system for converting waste materials into useful bio-gas and fertilizer, and/or soil amendment product, illustrated in Figure 1 [See Abstract]. The method includes sending wastes to an anaerobic treatment unit/digester (20). A conditioner for enhancing anaerobic digestion is not essential [See Column 4, lines 61-62]. The anaerobic treatment can be operated in the thermophilic temperature range (49-60°C) [See Column 5, lines 41-44]. Bio-gas is generated during anaerobic treatment. Bio-gas is made up of methane, carbon dioxide, and ammonia [See Column 5, lines 27-34]. The bio-gas produced during the anaerobic digestion stage can be collected and used for energy recovery, or stored for later use in a gas storage tank (5). Figure 2 further demonstrates the anaerobic

treatment unit. Each tank is completely gas-sealed with a bio-gas vent (23) and a bio-gas recirculation line (25F) [See Column 15, lines 27-30]. Ammonia vapor can be fed to an ammonia scrubber column (72). The ammonia vapor is contacted with an absorbent agent and condensed into a liquid form which is collected [See Column 6, line 56 – Column 7, line 22]. The Woodruff reference fails to teach the claimed pressure ranges. Furthermore, the Woodruff reference fails to teach the added limitation to circulating the excess gas from the absorption operation between the first and second vessel and it would not have been within the level of one of ordinary skill in the art to circulate the ammonia depleted gas back to the first reactor.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
